GLEB PAVLOV

Chicago, IL | gcpavlov@gmail.com | linkedin.com/in/glebcpavlov | pavlovsdogma.com

Full-Stack Engineer | *TypeScript, Next.js, PostgreSQL* | *Payments, Security & AI Agents*

SUMMARY

Full-stack engineer with 10+ years across finance, process engineering, and software. Owns production for a multi-city marketplace end to end: shipping product, keeping payments correct, closing security gaps, and running the infrastructure. Builds AI agent systems that do real engineering work, not demos. An accounting background means the numbers reconcile. Works comfortably between engineering, finance, and operations, and translates between them. Good at taking over messy systems, finding where they leak money or trust, and fixing them so they stay fixed.

TECHNICAL SKILLS

Languages & Frameworks: TypeScript, Python, React, Next.js, Node.js, SQL, Ruby on Rails, Go

Data: PostgreSQL (Neon), schema migrations, data migration and ETL, Drizzle ORM, Redis, NoSQL

Payments & Integrations: Stripe (Payments, Connect), billing (subscription and usage-based), REST APIs, Maxio (Chargify), QuickBooks, Twilio, Sanity CMS

Infrastructure & Delivery: AWS (Lambda, S3), Docker, Kubernetes, Terraform, CI/CD, Vercel, Temporal, Fly.io

Reliability & Security: Authentication (Clerk), role-based access control, automated testing (integration and end-to-end), monitoring and alerting, Sentry, rate limiting

AI: Claude Code (agents and skills), multi-agent pipelines, Model Context Protocol (MCP), LLM integration (OpenRouter), LLM evaluation (evals), TypeSafe Jev (typed LLM judgments)

EXPERIENCE

Director of Operations Engineering

Dec 2025 – Present

Bulqit, Chicago, IL (Hybrid)

Proptech marketplace that groups neighborhoods into buying groups for recurring home services. Hands-on individual contributor; no direct reports. Stack: Next.js, TypeScript, PostgreSQL, Temporal, Stripe, Twilio, Vercel, Fly.io.

- Designed and shipped a one-time services product line end to end (checkout, scheduling, and charge on completion) behind a feature flag after five adversarial design reviews.
- Built and operate a Claude Code agent pipeline that turns Linear tickets into pull requests: five specialized agents working test-first (failing integration tests define each goal), with adversarial review and a human merge call. Five tickets at a time, it handles a mean of 100 per 24 hours; PRs pass review in a weighted mean of 1.3 attempts (79% first, 12% second, 9% third).
- Rebuilt billing so the money is never wrong: a locked invoice ledger that corrected Stripe's fee model and reconciled vendor earnings, and retry-safe charging that makes double charges impossible, with a daily money monitor and reconciliation for finance.
  - Traced inconsistent fees to a ledger that recalculated charges from live settings and modeled Stripe's fee as a flat 3.0% instead of 2.9% plus 30 cents; rebuilt it as a locked invoice line-item ledger and reconciled three conflicting vendor-earnings figures into a single definition.
  - Eliminated double-charge risk on retries with durable Stripe idempotency keys and reconcile-before-retry, proved charges cannot double-apply with real-database race tests, and launched a daily monitor of four money invariants plus a Stripe and QuickBooks reconciliation export for finance.
- Closed critical account-takeover and authentication vulnerabilities, then added admin role-based access control with audit logging and database-backed rate limiting.
  - Closed five critical account-takeover paths, an unauthenticated credit-minting endpoint, and a production OTP backdoor; implemented admin role-based access control with audit logging and lockout protection, and moved rate limiting to PostgreSQL after finding the in-memory limiter never enforced on serverless.
- Resolved a production SMS outage caused by an account-wide Twilio binding limit shared across environments; isolated each environment's number pool and webhooks, increasing messaging capacity by 1,067% for $85 a month and cutting cost per connection by about 70%.

- Took over production from the founding agency and built the release process: blue/green deployments with CI-gated promotions (89% of production deploys, including a 116-ticket release) and a restored integration test suite that cut failing test files from 81 to 5.
  - Took over production from the founding development agency with no in-house release process; designed blue/green deployment slots with protected branches, CI-gated promotions, and slot-aware worker deploys, then triggered 89% of production deploys, including one release of 116 new tickets and 7 database migrations.
  - Found only 25 of 385 integration test files running in CI and a harness defect hiding failures; restored the suite on every pull request, scoped CI to essential suites, and cut failing test files from 81 to 5, adding secret scanning, dependency advisory, and migration-order gates.
- Built the operational safety net: health checks across 14 dependencies with automatic machine replacement, release-stamped Sentry and tiered alerts, approval-gated Claude Code skills for high-risk operations, and a one-command devenv/Nix environment.
  - Inherited background workers that could stop silently and reported every release as "dev"; built health checks across 14 third-party dependencies with automatic Fly.io machine replacement, release-stamped Sentry reporting, tiered alerts, and an hourly synthetic probe that proves alerting works.
  - Wrote and designed Claude Code skills that make high-risk business operations repeatable and auditable: production promotion pre-flight, merge trains, database and CMS content syncs with checkpoint-based conflict detection, telephony provisioning, and velocity reporting.
  - Built out the team's reproducible devenv/Nix development environment: local PostgreSQL, Temporal, Twilio mocks, secret scanning, and AI tooling context in a single command.

Resolved 408 engineering issues, 26% of everything the team completed, including 150 urgent or high-priority issues. Authored 342 pull requests across 245 tickets.

Programmatic Automation and Operations Consultant

May 2024 – Jul 2025

Self-employed (confidential client), *Remote*

- Established the business foundations for a stealth-stage proptech startup: entity setup, accounting and bookkeeping systems, and operating budgets.
- Contributed code, development environment setup, and service configuration to the marketplace platform build alongside an external development agency (Next.js, PostgreSQL, Temporal, Stripe, Twilio, Clerk, Sanity CMS), through its first production release in June 2025.
- Implemented a large language model chatbot that guides customers through onboarding, including secure collection of payment profiles and account setup.
- Designed automated financial, management, and investor-level reporting frameworks and led automation work in Python, PyTorch, Power Query, and AWS for financial and operational data processing.

Senior Process Manager

Jun 2021 – Dec 2023

Zentro Internet (formerly Everywhere Wireless), *Chicago*, *IL* | *Senior Manager*, *Process and Innovation*

- Led systems integration through the merger with Silver IP, consolidating two companies' CRM, billing, and payment data into a single unified database for the combined internet service network.
- Migrated customer payment vault tokens into a new recurring billing processor and designed the data hierarchy for a new CRM, backfilling legacy customer and serviced-property records.
- Built webhook-driven automation and internal forms in Python, Flask, and AWS Lambda for CRM and billing workflows.
- Developed automated KPI dashboards for customer service, construction, and sales, and partnered with leadership on M&A financial analysis and process realignment for newly acquired entities.

Process Manager

Apr 2019 – Jun 2021

Everywhere Wireless, *Chicago*, *IL*

- Built and led the Process and Innovation department after a leadership restructuring ahead of an expected acquisition, shifting from financial reporting to business systems that could scale with expansion.
- Implemented the company ERP and CRM, call center IVR and KPIs, and sales and contract-valuation KPIs, with API, webhook, and automated data migration pipelines.
- Automated dunning and payment collections, customer notifications, physical mail, and month-end journal entries, reducing accounts receivable cycle times.

- Built router polling and network uptime monitoring, and delivered EBITDA, FFO, discounted cash flow, and liquidity forecasting analysis for senior leadership.

Accounting Manager Sep 2015 – Apr 2019

Everywhere Wireless, Chicago, IL | Associate Director of Accounting and Finance

- Owned the month-end close for a multimillion-dollar business unit: closing entries, balance sheet and P&L reconciliations, physical inventory audits, capitalization and amortization schedules, and tax.
- Implemented recurring payment processing for retail credit card and bulk ACH property customers, integrating Maxio (Chargify) and First Data, including secure payment profiles, onboarding, and product catalog management.
- Built service-agreement valuation and property-level P&L reporting used to underwrite new network construction proposals for bulk internet clients.
- Managed and trained billing specialists and accountants across AR, AP, invoicing, cost coding, and biweekly payroll.

Earlier experience: Seasonal Tax Associate, PwC (Jan – May 2015); Finance and Accounting Staff, TRIO Student Support Services, Robert Morris University (Jul 2013 – Feb 2015).

PROJECTS

Autonomous AI Agent Pipeline github.com/gcp-bulqit/linear-pipeline

- Designed a Claude Code system that turns Linear tickets into reviewed pull requests: a supervisor and five specialized agents (discovery, planning, implementation, adversarial review, documentation) running any number of tickets in parallel, each in its own git worktree and database.
- Works test-first: failing integration tests define the goal, and a ticket is done when they pass with the existing suite and survive review. It posts to the ticket when it needs a human call and leaves codebase notes for later tickets.
- Built it to recover safely if stopped, with a staged state machine, one migration at a time, signed commits, and decision briefs, documented in 14 ADRs.

AI Ticket Triage and Routing System github.com/gcp-bulqit/ticket-triage

- Built an LLM triage system (TypeSafe Jev, Python) that asks ten typed questions per ticket, grounds the answers in git evidence, and applies code-defined thresholds to choose work for the agent pipeline; 33 of 43 picks shipped, and 82% passed first-attempt review versus 67% overall.
- Added a companion labeler that scores workability, ambiguity, effort, blast radius, and locatability and routes each ticket to the right human step; a hindsight-free backtest against 130 shipped tickets found 25% carried the wrong type label.

Claude Code Operations Skills Library github.com/gcp-bulqit/claude-ops-skills

- Wrote approval-gated skills that make high-risk operations repeatable: blue/green promotion pre-flight, merge trains with migration renumbering, and Twilio number provisioning.
- Designed checkpoint-based content syncs between dev and production databases and CMS that never overwrite production edits; reconciled 146 notification templates and avoided 23 broken images a naive copy would have caused.

Blue/Green Release System

- Replaced agency-era deploys with protected blue/green slots, CI-gated promotions, read-only production pre-flight checks, and migration dry-runs; shipped one release of 116 new tickets and 7 database migrations through the standby slot.

Developer Onboarding Documentation github.com/gcp-bulqit/dev-onboarding-docs

- Created the engineering onboarding repository: an infrastructure overview with an architecture diagram, 65 files of initial developer documentation, an accounts checklist, and a 686-line staging QA checklist with a pass/fail matrix.

EDUCATION

B.S., Accounting and Finance; B.B.A., Business Administration (dual major) 2012 – 2015

Robert Morris University – Illinois, Chicago, IL | GPA 3.9
